

Part 1. Reading Assignment

<http://pdf.coreservlets.com/HTTP-Request-Headers.pdf>

<http://pdf.coreservlets.com/HTTP-Status-Codes.pdf>

Part 2. Programming Assignment

Write a servlet to display request headers using:

Enumeration `getHeaderNames()`

Enumeration `getHeaders(String name)`

<https://docs.oracle.com/javase/7/api/javax/servlet/http/HttpServletRequest.html>

Part 3. Programming Assignment

Create an HTML to display the following form. The design and layout do not need to be the same as the form below. As long as you provide the same fields, that is fine. You may ignore the layout, but if you know Bootstrap and CSS, you may use it).

Then you create a Servlet to handle the form submission, and display the submitted information.

This is my form

Email:

Password:

Confirm Password:

Upload Your Picture:

Gender: ☐ Male ☐ Female

Select Country:

Hobby: ☐ Cricket ☐ Football

Address

You may ignore the layout and form design.
Create the form in any way you like.
Use of Bootstrap and CSS is not required.

PART 4. Programming Assignment

Create an HTML form to capture the information as shown in the following PDF page. PDF forms are designed to print and fill out by hand, so the layout is optimized to fit all the fields in a single page, but there is no such a requirement for the layout for the web forms. So, the design and layout of the form may be very different from the PDF form. Design the web form in any way you like, using CSS libraries if you like, to capture the same information. Also, in the layout, you may see underlined fields or table cells for users to write information, but you cannot capture user input from an HTML page just by underlining or creating a table cell. A form element is needed for users to enter information. <https://www.northeastern.edu/hrm/pdfs/2016boe/enrollment-form-2016.pdf>

Then you create a Servlet to handle the form submission, and display the submitted information.

PART 5. Programming Assignment

Create a servlet to display all the `getX()` methods defined in the `HttpServlet` class,

<https://javaee.github.io/javaee-spec/javadocs/javax/servlet/http/HttpServlet.html>

and all the inherited `getX()` methods:

<https://javaee.github.io/javaee-spec/javadocs/javax/servlet/GenericServlet.html>

If a `getX()` method returns something that cannot be printed, just skip that method.

PART 6. Programming Assignment

Create a servlet to display all the `getX()` methods defined in the `HttpServletRequest` interface,

<https://javaee.github.io/javaee-spec/javadocs/javax/servlet/http/HttpServletRequest.html>

and all the inherited `getX()` methods:

<https://javaee.github.io/javaee-spec/javadocs/javax/servlet/ServletRequest.html>

If a `getX()` method returns something that cannot be printed, just skip that method.
